Overview

- Background information on genetic improvement and DNA marker technology
- Improvements in genetic gain possible from including DNA information into genetic predictions
- Genetic tests that are on the market for production traits
- DNA testing for recessive genetic defects

Traditional animal breeding on the basis of phenotype (appearance) can be very successful

However breeding based on objective performance recording has been spectacularly successful.....

Image from: Dekkers, J.C.M, and F. Hospital, 2002. The use of molecular genetics in the improvement of agricultural populations. *Nature Reviews Genetics* 3: 22-32

What is an EPD?

An animal's **breeding value** is an estimate of its genetic merit, half of which will be passed on to its progeny – this is called the Expected Progeny Difference (EPD). While we will never know the exact breeding value, for performance traits it is possible to make good estimates based on performance records of the animal and its relatives.

Typical EPD Genetic Evaluation

- Calving ease
- Birth Weight
- Weaning Weight
- Yearling Weight
- Milk
- Scrotal
- %IMF
- REA
- %RP
- a mix of others

Interpreting an EPD

Sire X has a weaning weight EPD of +20
Sire Y has a weaning weight EPD of +10.

EPDs form a basis for comparison between bulls
– on average a +20 WW EPD bull will have calves that weigh 10 more pounds at weaning than a +10 WW EPD bull.

Boyd Heritage was not only Champion sale bull in Denver, he was the high selling bull at \$55,000. As Champion of the North American International he displayed flawless structure and confirmation. Heritage stems from the cow family behind bulls like Traveler 004, New Day, On Target, Beef Maker, and Poundmaker. This low 6 frame bull promises excellent growth, thickness, maternal strength and carcass merit. BW 87 lb., WW 744, YW 1,288.

Do EPDs work?

Progeny from Angus bulls with high ($>.4$) and low (< -0.16) EPDs for marbling were compared. 74% of high offspring graded choice versus 47% of low EPD offspring.

Vieselmeier, B. A., R. J. Rasby, B. L. Gwartney, C. R. Calkins, R. A. Stock, and J. A. Gosey. 1996. Use of expected progeny differences for marbling in beef: I. Production traits. *J Anim Sci.* **74**:1009-1013.

Challenge for breeders is to accurately identify those individuals that have the best true breeding values

- Performance records – more are better
- Would ideally like records before selection
- **The promise:** Perhaps DNA information can help improve the accuracy of breeding values for all traits based on DNA samples taken upon birth – BEFORE selection

Traditional Genetic Evaluation and EPD-based Selection

Selection on EPDs (derived from the observable performance of the animal and its relatives) has the effect on increasing the frequency of favorable alleles (and sometimes unfavorable alleles) without knowing the corresponding genes and molecular mechanisms

The genome age

GENES CONTAIN INSTRUCTIONS FOR MAKING PROTEINS

PROTEINS ARE THE BUILDING BLOCKS OF LIFE AND COLLECTIVELY ACT TO DETERMINE PHENOTYPE

SNP (Single Nucleotide Polymorphism)

A DNA sequence variation that varies sufficiently between individuals that its inheritance can be tracked through families

What is a Genetic Marker ?

A DNA sequence variation that has been associated with a given trait in one or more populations

What is needed for develop a DNA test?

TRAINING

- Population
- Phenotypes
- Genotypes

Training = Need a population where genetic markers have been associated with production traits in **BREED** of interest

Prediction = the results of training can then be used to predict the genetic merit of new animals based on their DNA genotype alone

There are DNA-markers for simple traits

- DNA test result is highly predictive
 - Coat color
 - Polled/horned status
 - Certain genetic diseases (e.g. "curly calf")

SIMPLE TRAITS

e.g. Coat Color

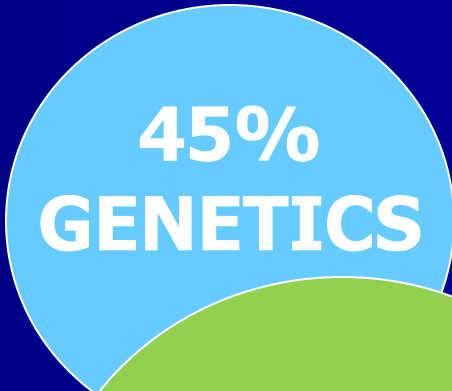

COMPLEX TRAITS

e.g. Marbling ($h^2 = 0.45$)

Igenity L was a single T/C SNP test for Leptin

Know. Now.

Igenity™ L. Know. Now.

Advanced technology. Advanced knowledge.

What if there was a test that could tell you – in advance – an animal's genetic potential for energy utilization or carcass quality? You'd have the advantage of knowing an animal's potential now, instead of discovering it later through success or failure in the milk string or when the animal goes to market.

Researchers have discovered the specific gene that carries the code for the production of a protein called *leptin*. Leptin is associated with an animal's potential for appetite and energy utilization, among other things.

- For *dairy cattle* this translates directly into maximum dry matter intake (DMI) and peak milk production.
- For *beef cattle* it relates to days on feed and carcass quality.

The IGENITY™ L Test identifies leptin genotype (L-tt™, L-ct™ or L-cc™). Now you have another important resource to help you breed, feed, sort, manage and market cattle at an optimum level.

- Leptin is involved in the regulation of feed intake, energy balance, milk production, milk components, marbling scores, puberty, fertility and immune functions.
- Knowing an animal's leptin genotype empowers you to make more informed, strategic management decisions regarding breeding and nutrition.
- The IGENITY L Test identifies an animal's leptin genotype at the DNA level, with 100% accuracy.

Market your cattle with

 L-ct.

 L-cc.

BOVIGEN....

BOVIGEN SOLUTIONS, LLC

MARBLING

GeneSTAR™ Marbling is a DNA genetic marker test offered by **Bovigen Solutions,™ LLC** for a major gene (Thyroglobulin) associated with marbling. This marker provides beef producers the opportunity to determine an animal's potential for improved marbling more accurately and at an earlier age.

Marbling Results (% Choice) Difference

Yearling Fed	58%	62%	74%	16%
Calf Fed	34%	41%	53%	19%
NBCEC Trial ¹	47%	54%	64%	17%

In independent trials on over 1500 head, 2-STAR animals produced 16-19% more choice carcasses than 0-STAR animals. Equally important was the effect that the proportion of carcasses qualifying for premium Quality Grades doubled (21% vs. 10%) in 2-STAR carcasses versus 0-STAR.

¹ Trial was a study conducted by an independent third party.
- National Beef Cattle Evaluation Consortium.

LEGEND

- The results of the GeneSTAR™ tests are reported as:
- 2-STARS = two copies of the desired gene
 - 1-STAR = one copy of each form of the gene
 - 0-STARS = no copies of the desired gene

"DNA technology, although in its infancy in the beef cattle industry, can help us by identifying genes that effect marbling and tenderness. Tenderness seems to be one that interests many who produce and have concerns for improving end product value for our consumers. The GeneSTAR™ testing at Summitcrest has identified a number of cattle homozygous for marbling and tenderness genes. Having done that, we added market value to our cattle and new customers, even from other breeds of cattle, with tenderness concerns."

- Henry Bergfeld, Summitcrest Farms

HOW DO I USE THIS IN MY BREEDING PROGRAM?

Using 2-STAR sires is the quickest way to influence the presence of these genes in a herd. In addition, selecting 2-STAR females will more rapidly increase the frequency of the positive forms of these genes. Overall, selecting 2-STAR animals with appropriate EPDs and good structural and breeding soundness is the recommended way forward.

Mating Design

Sire is	Dam is	% of Progeny		
		100%		
		50%	50%	
			100%	
		50%	50%	
		25%	50%	25%
		50%	50%	
		100%		
		50%	50%	
				100%

Which would you rather have???

- A bull that is 'homozygous' for a positive genetic variant with a low-accuracy marbling EPD of +3, or
- Or an unrelated bull carrying no copies of that genetic variant with a low-accuracy marbling EPD of +3

Both are important!!

- The 'homozygous' bull is a source of favorable alleles (genetic variant) of the gene. Can eventually be used to create homozygous calves
- The other bull contributes favorable unmarked alleles of other genes, which will improve the frequency of other desirable alleles for the trait.
- Breeding the marker-associated form of the gene into the bull that has no copies should improve the trait by combining all of the good forms of the genes together in one animal

DNA TEST FOR MARBLING EXPLAINS SOME % (r^2) OF GENETIC VARIATION

**45%
GENETICS**

**EPD
estimates
all genes**

Recap of early product offerings

- Single gene tests reported as actual results of genotyping (** or AT)
- Great deal of explanation of what the gene was and how it had its effect
- DNA-test billed as 100% accurate
- The need for third-party validation of commercial tests becomes evident
- A lot of emphasis was put on a single SNP

First multi-gene test arrives

GeneSTAR TENDERNESS

GeneSTAR Tenderness was the first multi-gene single trait DNA test commercially available to the beef industry. It combines test results for several markers and genes for the same trait. The test is based, in part, on two genes involved in the post-mortem tenderization process: Calpastatin and Calpain. Calpain is an enzyme which weakens muscle fibers thereby making the fibers more tender. Calpastatin is an enzyme which inhibits the post-mortem tenderization process by inhibiting the effects of Calpain.

0	☆☆		100%	
0	☆		50%	50%
0	0			100%

This Mating Design illustrates Mendelian Heredity and the probability of results from mating a 0, 1 or 2 STAR Sire and Dam.

DNA tests should be considered additional information to be used in conjunction with available performance data for each animal. When comparing two bulls with similar EPDs, GeneSTAR GPD results can be used to further evaluate an animal's true genetic potential.

BOVIGEN COMPANY PROFILE

Bovigen, LLC is an innovative-driven genomics company developing a portfolio of world class DNA technological products. Our mission is to promote excellence in the beef industry through

IGENITY® TenderGENE™

A practical, powerful
tenderness selection tool.

IGENITY® TenderGENE™

The inside track
to tender beef.

IGENITY® TenderGENE™ profiles the tenderness potential of an animal and is:

- A powerful and comprehensive tenderness selection tool
- Fully validated by the National Beef Cattle Evaluation Consortium (NBCEC)
- Informative in all breed types, including *Bos indicus*

IGENITY TenderGENE analyzes multiple markers associated with the calpain and calpastatin genes. Both of these genes are important for profiling an animal's potential for tenderness:

- Calpain enzymes weaken muscle fibers during the post-mortem aging process.
- Calpastatin interacts with the calpain enzymes to impact overall tenderness.

Together they have a significant effect on tenderness as measured by Warner-Bratzler Shear Force (WBSF). In fact, in independently validated research, the calpain and calpastatin markers included in IGENITY TenderGENE are associated with **improving tenderness as much as 2.3 lb.**

The benefits of IGENITY TenderGENE are proven.

- IGENITY TenderGENE includes markers discovered by researchers at the U.S. Meat Animal Research Center (MARC) and the University of Guelph.
- IGENITY TenderGENE is a powerful tenderness test that is fully validated by the NBCEC.
- Validation work involved cattle from the NCBA National Carcass Merit Project.
- Research included more than 1,200 animals, representing all breed types.
- Because of the favorable effect on WBSF of **up to 2.3 lb**, selecting for tenderness using IGENITY TenderGENE can help ensure a quality eating experience for consumers.

Learn how this inside information can give you a competitive edge. Call 1-877-IGENITY.

What do you bring to the table?

★★★ Tenderness

★★★ Marbling

GeneSTAR DNA Test Results						
	FE1	FE2	FE3	FE4	Total	GPD
Feed Efficiency	★★★	★★	★★	★★★	6	-3.2

In this example, the results describe an animal for Feed Efficiency. The genes identified for Feed Efficiency thus far, identify cattle with lower Net Feed Intake (NFI). Cattle with lower NFI will eat less without sacrificing ADG or any other performance trait. The animal in this example will consume **3.2 lbs less feed per day** and still have the same ADG and Marbling potential as the rest of his contemporary group. Simply put, the more STARS for Feed Efficiency, the less feed consumed without sacrificing any performance!!!

GeneSTAR DNA Test Results					
	T1	T2	T3	Total	GPD
Tenderness	★★★	★★	★★★	5	2

In this example, the results describe an animal for its Tenderness potential. Nationwide, tenderness is measured by Warner-Bratzler Shear Force, or the pounds needed to cut a core sample from a ribeye. The animal in this example will produce a ribeye that is 2.0 pounds more tender than an animal without the STARS for tenderness.

The GeneSTAR Tenderness panel continues to lead the industry in identification of markers for one of the most valuable traits for producing a quality eating experience. GeneSTAR animals that are homozygous for all the Tenderness markers (T1, T2, T3) show a difference in Tenderness that virtually eliminates the "unsatisfactory eating experience" that plagues nearly 25% of all carcasses compared to an animal devoid of these genes.

GeneSTAR DNA Test Results						
	QG1	QG2	QG3	QG4	Total	GPD
Quality Grade	★★★	★★	★★★	★★	6	27.42

In this example, the results describe an animal for Quality Grade. The genes identified thus far for Quality Grade work across all breeds and identify animals with a greater chance of grading Choice or higher. The animal in this example has a 27.42% greater chance of grading Choice or higher than an animal with out the STARS for Quality Grade.

GeneSTAR **FEED EFFICIENCY**

www.bovigen.com • 1.877.BEEF.DNA

USDA PROCESS VERIFIED

INDEPENDENT 3RD PARTY VALIDATION

1.877.BEEF.DNA

www.bovigen.com

250 Plouche St.

Harahan, LA 70123

FEATURES

- Contains 128 DNA markers where each marker is highly associated with expression of marbling score
- Measures the cumulative effects of all 128 markers associated with marbling
- Results are expressed as the Molecular Genetic Value (MGV) which can be utilized to rank animals by their genetic potential
- Animals can be tested at any age
- Validated in Angus (validation in other breeds is underway)

BENEFITS

- The most powerful and comprehensive DNA selection tool currently available for marbling
- Accounts for a significant proportion of total observed genetic variation for marbling
- Results are easy to utilize and incorporate into any existing breeding program
- Can be used to make early selection and breeding decisions
- Provides accurate and reliable results for ranking and/or selection of animals

TRU-MARBLING™

One in a series of break-through products that will advance breeding practices in the cattle industry, *Tru-Marbling™* is a powerful and comprehensive DNA selection tool that can determine the genetic potential of animals to express marbling. In a collaborative research program between Cargill and MMI Genomics, an innovative scientific approach was used on over 4000 feedlot animals to identify the majority of regions throughout the bovine genome that have an effect on this economically important trait.

Tru-Marbling™ is a DNA-based genetic test that contains a panel of 128 unique DNA markers, each one highly associated with the expression for marbling score and quality grade. By measuring the cumulative effects for each of these 128 markers, *Tru-Marbling™* accounts for a significant proportion of the total genetic variation for this complex metabolic trait—the first DNA-based product to do so!

Tru-Marbling™ is an advanced and revolutionary tool that will allow cattle producers to make early breeding decisions that **increase the accuracy** of selection and **decrease the age** at which animals can be selected.

The results? Rapid improvement of marbling within herds and the ability to determine the "Tru" genetic potential of animals.

PROVEN RESULTS

Tru-Marbling™ has been validated in both commercial cross-bred feeder cattle populations and in Angus cattle.

The validation in Angus was conducted using samples from the National Carcass Merit Project, representing Angus sires bred to Angus-based commercial cows. While this is a small population of animals, the data indicate that *Tru-Marbling™* accounts for **70% of the genetic variation** observed in this population.

No. of samples:	414
Heritability*:	0.36
No. of markers:	128
Phenotypic variation explained (R ²)**:	0.25
As a percent of Heritability	70%

* Angus National Cattle Evaluation, Spring 2007
** estimated from a model that included contemporary group and MGW

Tru-Marbling™ has also been validated against commercial cross-bred feeder cattle populations. This study utilized 89 marbling markers that are a subset of the 128 markers used in the purebred Angus population. The data clearly demonstrates the relationship between quality grade and average Molecular Genetic Value (MGV).

Quality Grade	STEERS			HEIFERS		
	Number	% of total	Avg. MGV	Number	% of total	Avg. MGV
Prime	9	0.1%	14	5	0.1%	14
High Choice	93	1.1%	20	78	1.3%	12
Medium Choice	475	5.8%	14	423	7.0%	9
Low Choice	2006	24.3%	7	1526	25.2%	0
High Select	3989	48.3%	-6	2835	46.9%	-9
Low Select	1344	16.3%	-14	915	15.1%	-20
No Rail	337	4.1%	-20	268	4.4%	-23
Totals	8255	100.0%		6950	100.0%	

14,305 head tested from 8 commercial feedlots

Unlike other products, *Tru-Marbling™* MGVs account for a highly significant amount of variation for marbling score.

Explains 70% of the genetic variation in marbling with 128 markers

TRU-TENDERNESS™

One in a series of break-through products that will advance breeding practices in the cattle industry, *Tru-Tenderness™* is a powerful and comprehensive DNA selection tool that can determine the genetic potential of animals to produce tender meat. In a collaborative research program between Cargill and MMI Genomics, an innovative scientific approach was used on over 4000 feedlot animals to identify the majority of regions throughout the bovine genome that have an effect on this valuable consumer trait.

Tru-Tenderness™ is a DNA-based genetic test that contains a panel of 11 unique DNA markers, each one highly associated with expression for tender meat. By measuring the cumulative effects for each of these 11 markers, *Tru-Tenderness™* accounts for a substantial proportion of the total genetic variation for this complex metabolic trait.

Since tenderness can only be measured in harvested cattle it is difficult, time consuming and expensive to make genetic progress for this trait using traditional genetic improvement tools. *Tru-Tenderness™* changes this paradigm by allowing producers to accurately assess the genetic potential of their breeding stock to produce tender meat. In addition, *Tru-Tenderness™* also shortens the interval for making genetic progress because it can be used to test animals of any age.

Tru-Tenderness™ is an advanced and revolutionary tool that will allow cattle producers to make early breeding decisions that **increase the accuracy** of selection and **decrease the age** at which animals can be selected.

The results? Rapid improvement of tenderness within herds and the ability to determine the "Tru" genetic potential of animals.

PROVEN RESULTS

Tru-Tenderness™ has been validated in Angus using samples from the National Carcass Merit Project, representing Angus sires bred to Angus-based commercial cows. While this is a small population of animals, the data indicate that *Tru-Tenderness™* accounts for 100% of the genetic variation observed in this population as measured by Warner-Bratzler shear force.

No. of samples:	407
Heritability*:	0.35

Results reported on 1-10 scale

The IGENITY profile.
Comprehensive. Practical. Powerful.

It's easy to understand an IGENITY profile.

One of the greatest values of the IGENITY profile is that all results are integrated and provided in one single profile, similar to the report shown here.

IGENITY Profile

Animal ID	M/F	Breed	Sample Barcode #	Tenderness	Red/Black Coat Color	Heifer Pregnancy Rate	Yield Grade	Ribeye Area	Hot Carcass Weight	Quality Grade	Stayability	BVD-PI	Polled

TRU-MARBLING and TRU-TENDERNESS REPORT

BREED	NAME	REG #	TAG/ TATTOO	SEX	BORN	SAMPLE ID	MARBLING MGV	TENDERNESS MGV
Angus	AF Paul Bunyan	19352178	AZ-105	M	06/14/2004	0539812G	-28.61	0.92
Angus	AF Casey Jones	19352211	AZ-112	M	05/29/2004	0539813G	-19.41	-3.98
Angus	AF Alamo Rising	19352385	AZ-146	M	06/19/2005	0539814G	42.79	-0.75
Angus	AF Geronimo	19352448	AZ-175	M	12/20/2004	0539815G	70.15	-4.40

All four animals represented in the above test result have *Tru-Marbling*TM and *Tru-Tenderness*TM MGVs. All MGVs within a trait have the same accuracy because every animal has the same number of markers in the prediction of genetic potential.

Paul Bunyan and Casey Jones are predicted to grade in the low Select and No Roll USDA grades because of their large negative marbling MGVs. Alamo Rising and Geronimo are predicted to grade in the USDA grades of high Choice and Prime because of their high MGVs for marbling. MGVs near 0 are expected to grade in the high Select USDA grading category.

Paul Bunyan is predicted to produce tough meat with the larger MGV for *Tru-Tenderness*TM. Casey Jones and Geronimo are predicted to produce very tender meat. Alamo Rising is predicted to produce acceptable tenderness, bordering on slightly tough.

These results can be used to rank bulls for their genetic potential for marbling and tenderness.

Feed Efficiency

GeneSTAR® Feed Efficiency is based on **Net Feed Intake (NFI)**. NFI is the difference between an animal's actual feed intake and the amount of feed an animal is expected to eat based on its size, composition and growth rate.

Calves that eat less than expected will have a negative NFI

Negative NFI = Superior Feed Efficiency

Calves that eat more than expected will have a positive NFI

Positive NFI = Inferior Feed Efficiency

GeneSTAR® GPD® Feed Efficiency

Difference between Actual and Expected Lbs consumed per day

Tenderness

GeneSTAR® Tenderness was the first multi-gene single trait DNA test commercially available to the beef industry. It combines test results for several markers and genes for the same trait. The test is based, in part, on two genes involved in the post-mortem tenderization process: Calpastatin and Calpain. Calpain is an enzyme which weakens muscle fibers thereby making the fibers more tender. Calpastatin is an enzyme which inhibits the post-mortem tenderization process by inhibiting the effects of Calpain.

* Values derived from Independent Validation Population

Results are reported as 0-2 STARS per marker for use in mating decisions along with the GPD, which reflects the "true" value of the animal's unique combination of markers.

Quality Grade

GeneSTAR® Quality Grade is a DNA genetic marker panel test offered by Pfizer Animal Genetics which identifies the presence of multiple major genes associated with quality grade. These markers provide beef producers with a quicker and more accurate test to determine an animal's potential for improved quality grade. GeneSTAR® Quality Grade includes TGS, which was the first gene marker for a production trait in beef cattle. This panel of markers is the only marbling or quality grade test to have passed an independent validation by the National Beef Cattle Evaluation Consortium.

Recap of next generation of products

- Multigenic marker panels start to become the norm
- Number of traits and markers grow exponentially
- No longer any emphasis on which genes the markers are associated with, or how those genes function
- No independent validation of many tests
- Multiple different reporting systems that do not allow interchange (1-10, MGW, GPD, Number of Stars) or interpretation relative to EPDs
- DNA information still being presented separately from EPDs

The Power of the IGENITY[®] profile for Angus

The American Angus Association[®] through its subsidiary, Angus Genetics Inc.[®] (AGI), has a vision to provide Angus breeders with the most advanced solutions to their genetic selection and management needs.

Genomic-enhanced Expected Progeny Differences (EPDs) can now be calculated for your animals using the highly predictable American Angus Association database along with IGENITY[®] profile results to provide a more thorough characterization of economically important traits and improved accuracy on young animals.

Using the IGENITY profile for Angus, breeders receive comprehensive genomic results for multiple, economically important traits.

G A R Predestined:

From start to finish--conception to carcass--no other bull in the beef business today adds as much real value to cattle as Predestined. Ranking as the #1 bull for \$B in the breed--our customers tell us that their Predestined-sired cattle return the most dollars to their pockets--they know that \$B works. Unlike any other 036 son, Predestined tones down size, adds depth of flank, superior feet and legs and a pleasant disposition to his offspring. His conception rate is high and he's been a standout in timed-AI programs. His progeny look good--his bulls are thick and his heifers are fancy--and they always display additional shape and capacity. He ended 2006 as our top-seller and rightfully so--Predestined's many talents for creating value are for real.

Summary

- Selection requires accurate identification of genetically superior animals to become parents of next generation
- Accuracy of EPDs can be improved by
 - Having performance records on individual and its relatives
 - Maintaining contemporary groups – especially in feedlot
 - DNA tests that have been shown to work in Wagyu breed
- Need training populations of each breed of cattle with records and genotypes to develop accurate DNA tests for each breed

DNA tests are most valuable for traits that are

- **low heritability** (influence that genetics rather than environment has on a trait)
- **are difficult or expensive to measure** (feed efficiency)
- **cannot be measured until after selection has occurred** (carcass data)
- **are currently not selected for due to lack of available phenotypic data** (tenderness)

There are a large number of genetic abnormalities in cattle occurring in a variety of breeds.

THE BATTLE OF BULL RUNTS

By L. P. McCANN

The March to Victory

A 1956 survey of Hereford breeders in the USA identified 50,000 dwarf-producing animals in 47 states.

Through detailed pedigree analysis and test crosses, the American Hereford Association, in concert with breeders and scientists, virtually eliminated the problem from the breed. Because carrier status was difficult to prove and required expensive progeny testing, some entire breeding lines were eliminated.

Arthrogryposis multiplex; aka Curly Calf

- From a scientific standpoint, AM is the complete deletion of a segment of DNA that encompasses two different genes
- One of these genes is expressed at a crucial time in the development of nerve and muscle tissue. The mutation results in no protein being produced from this gene and therefore it is unable to carry out its normal function so homozygotes show phenotype

From September 8 – November 3, 2008 identified genetic problem, developed test, and released carrier status of 736 bulls!

- In the 11 months following the release of the test, the AAA posted the results of tests for AM on about 96,247 cattle.
- **This amounts to \$2.4 million in testing costs**
- Of these, 20% (19,529) were carriers of AM. **That leaves 23,638 bulls and more than 53,000 heifers which tested as free of AM.**
- **At \$4K/bull and \$2K/heifer ~ \$200 million of suspect animals shown to be free of RGF allele**

Based on calculations in Buchanan, D.S. 2009. Genetic Defects in Cattle.

<http://www.ag.ndsu.edu/williamscountyextension/livestock/genetic-defects-in-cattle>

COST (@ \$25/test)	7,351,350

Numbers kindly shared by Bryce Schumann, American Angus Association

If you breed a curly calf carrier cow (AMC) to an curly calf free bull (AMF), what is the chance that the offspring will be stillborn as a result of being curly calf?

1. 0
2. $\frac{1}{4}$ (25%)
3. $\frac{1}{2}$ (50%)
4. $\frac{2}{3}$ (66%)
5. $\frac{3}{4}$ (75%)
6. 1 (100%)

Genetic implications of recessive genetic factors

"Carrier animals...their overall breeding value worth may outweigh the economic value of carrier status"

Chalier C. et al. (2008) Highly effective SNP-based association mapping and management of recessive defects in livestock. *Nature Genetics* 40:449-454

Should the market decide or should this choice be directed by industry (e.g. disallowing registration of known carriers)?

Some questions that remain about recessive genetic defects

- If all animals carry recessive genetic factors/defects – how should “defects” be managed
- Can 50K or 800K data be also used to identify carrier status to spread the costs of DNA extraction. If so does it infringe on diagnostic test patents/IP
- Can we use genomics to better manage recessive genetic factors/defects
- Are appropriate decision support tools available for producers

Ideally cattle would be genotyped once early in life and genotypes shared among production sectors to derive the maximum value from the fixed DNA collection and extraction costs

Figure from McEwan, J. C. 2007 Current status and future of genomic selection. Proceedings of the New Zealand Society of Animal Production 67: 147-152.
